Comments about the designed part of application:

- in my application I have 3 <u>multiple topics</u> (Courses, Rooms, Teachers), creating a new course you may choose from teachers, that there are in database. Every course may have only one teacher assigned, every teacher may have unlimited number of courses (in the P-IDM schema there is an approximate cardinality value for this relation, but an application permits to create much more);
- in my application I have 4 <u>single topics</u>: Admin Part, Contacts, Academy Council and Student Support;
- Student Support has links to 3 <u>dialogue acts</u>, connected by «<u>all-to-all</u>» scheme;
- Admin Part is an entry page, where you may access to the <u>groups of topics</u> «All courses», «All teachers», «All rooms» (in the application they are called «Courses», «Teachers» and «Rooms» respectively);
- pushing at «All courses» you may see several buttons «Year X»- this is a <u>multiple group of topics</u> «Courses by year». Furthermore, there is a button for showing all the available courses;
- in the «Detailed information» for every teacher there is a possibility to see his courses (<u>page of a transition act</u>);
- You may always return to the home page using the brown button «Back to index» (one of the <u>landmarks</u>);
- I used 7 CSS- 1 for each type of multiple topics, 1 for static pages, 1 for «flash», 1 for the design of buttons and the last one- for a general background;
- new views and controllers were created for each single topic;
- unfortunately, I had no time to make the full site- so I made only that minimum set of pages, which is necessary to evaluate a project
